

How to Use Visibility Layers in PhotoMirage

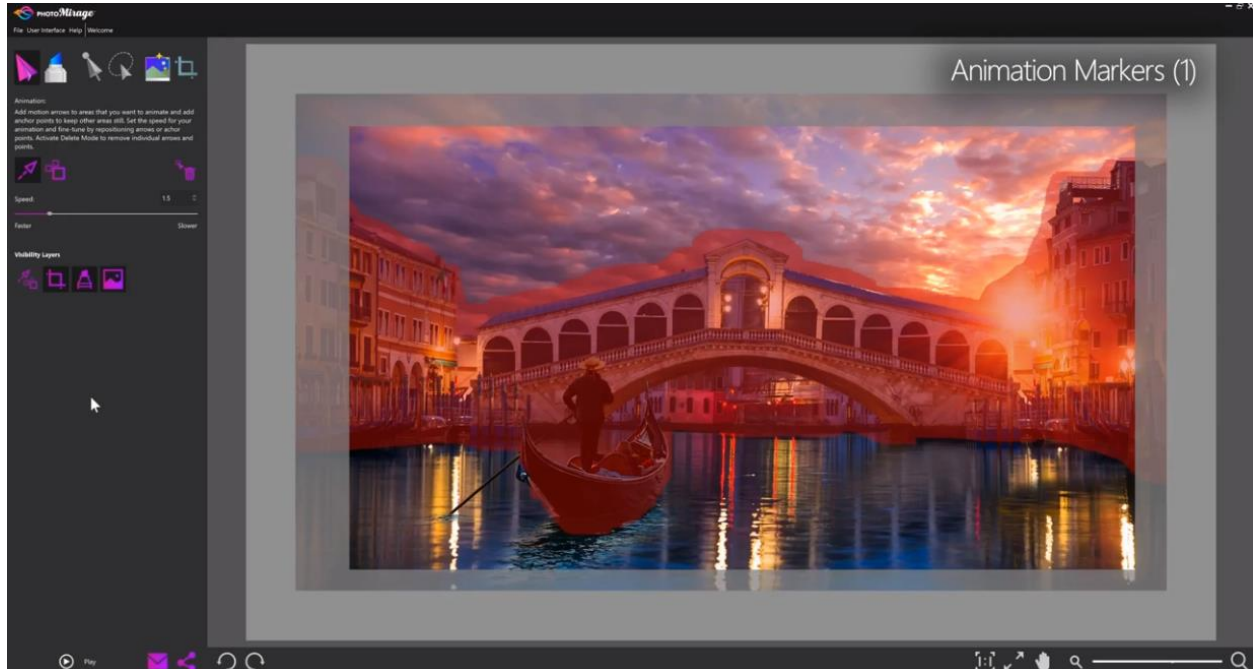

Visibility layers can help you see what you are working on more clearly, by showing or hiding different elements of your photo animation project.

The **Visibility Layers** panel has 4 options:

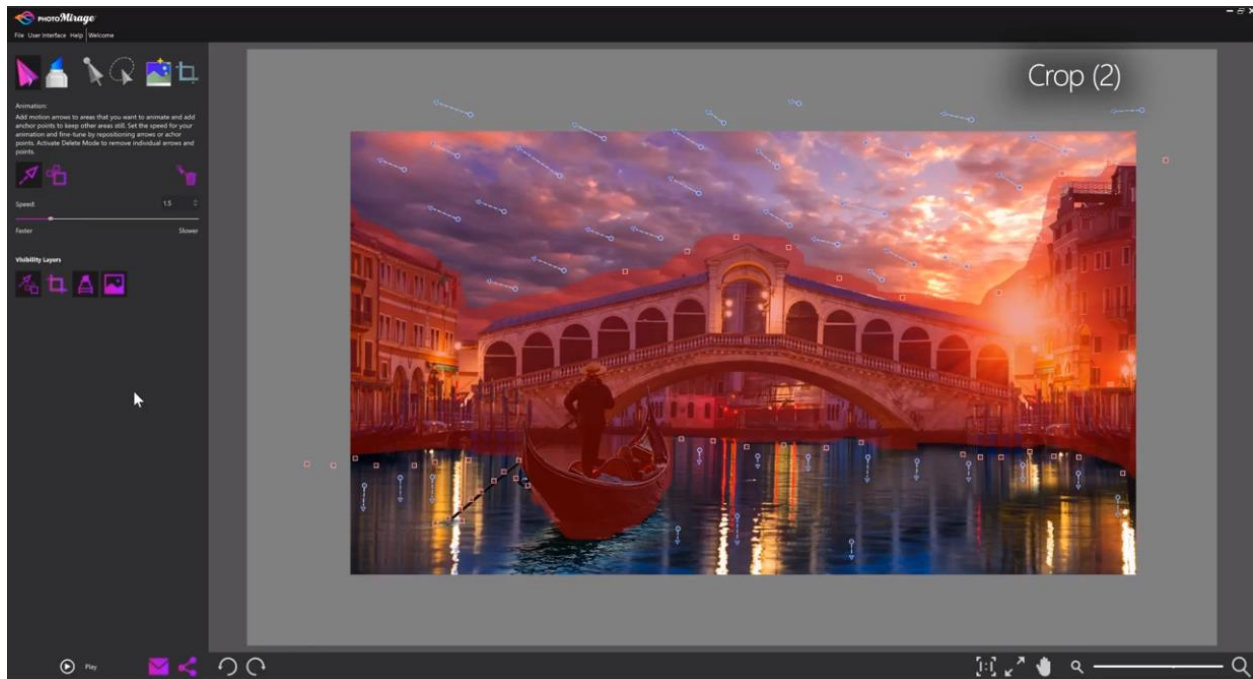

- Animation Markers
- Crop
- Mask
- Image

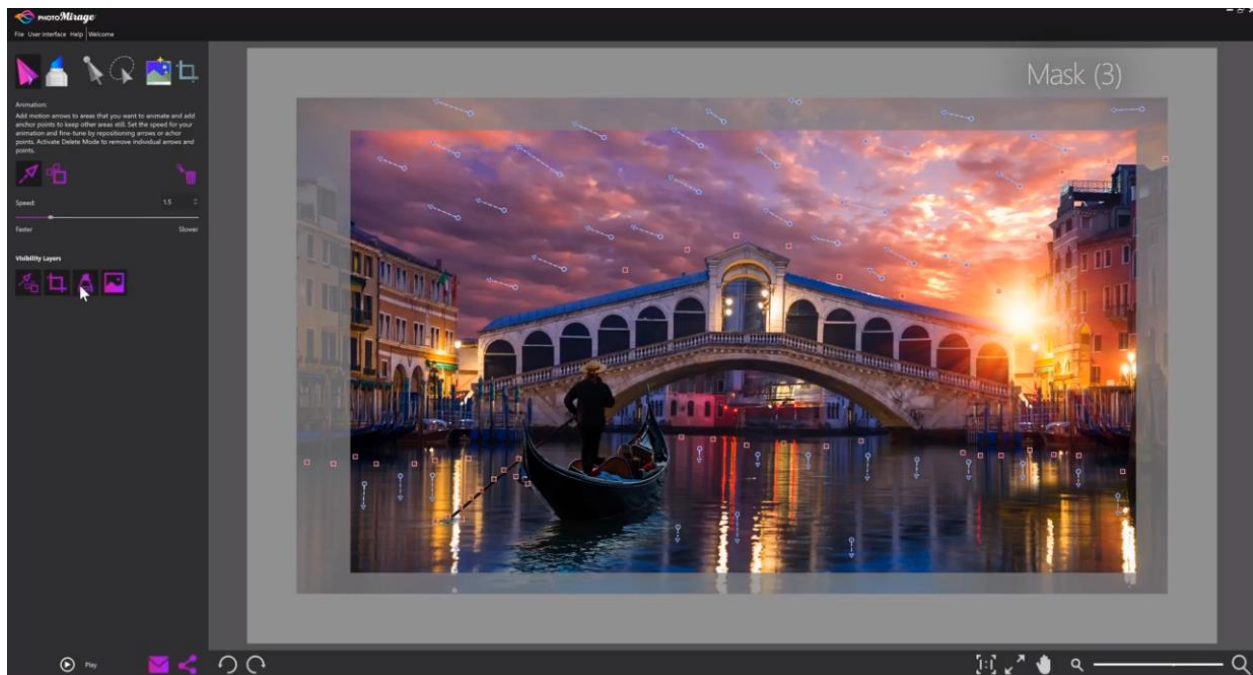

Click the **Animation Markers** button to toggle **Motion Arrows** and **Anchor Point** visibility on and off.

Click the **Crop** button to toggle the crop box visibility on and off, to better visualize your final image.

Click the **Mask** button to toggle on and off the visibility of the mask area.

Click the **Image** button to toggle on and off the image itself.

Note that none of these settings affect the final animation, they are strictly visual aids for your editing process.
